FRESHMART

Business Insights & Management Recommendations

Sales & Business Performance Dashboard | Excel Analysis

Purpose: Translate the completed FreshMart dashboard into stakeholder-ready business insights aligned with the BRD.

1. Executive Summary

FreshMart generated **28.95 lakh in revenue** and **7.42 lakh in profit**, producing a displayed profit margin of **25.63%**. The dashboard connects overall performance with monthly trends, store/product/category performance, sales channels, discounts and return-status filtering.

The strongest revenue channel is **In-Store** (69% of revenue). **Beverages** is the largest revenue category, while **Bakery** generates the highest total profit. This difference reinforces the BRD's central point that sales volume should not be evaluated independently of profitability.

2. Executive KPI Snapshot

Metric	Dashboard Value	Business Meaning
Total Transactions	2,500	Transaction rows represented in the dashboard
Total Quantity Sold	9,823	Total quantity sold
Total Revenue	Rs. 2,894,662.90	Total sales amount
Total Profit	Rs. 741,797.12	Total profit
Profit Margin	25.63%	Profit as a proportion of sales

3. Dashboard Insights

Overall performance

Revenue is Rs. 2,894,662.90, profit is Rs. 741,797.12, and the displayed profit margin is 25.63%. This provides management with the executive-level performance view required by the BRD.

Monthly trends

The highest-revenue month is Oct 2025 with Rs. 447,130.54 revenue and Rs. 115,858.42 profit. The highest transaction-volume month is Oct 2025 with 372 transaction rows.

Store performance

FreshMart Ahmedabad Complex is the highest-sales store among the displayed Top 10, with Rs. 46,791.24 sales and Rs. 13,302.19 profit. The Region slicer supports further store-level investigation.

Product profitability

The Top 10 Product chart compares sales and profit side by side. This directly addresses whether the highest-selling products are also the most profitable, which is a core BRD question.

Category performance

Beverages is the largest revenue category at Rs. 482,999.39, but Bakery has the highest total profit at Rs. 149,305.74. Its approximate profit margin is 40.88%.

Sales channels

In-Store contributes approximately 69% of revenue, followed by Online (21%) and Mobile App (10%).

Discount pattern

The aggregated profit margin is 30.88% at 0% discount and 14.79% at 20% discount. This indicates an association between higher discount levels and lower aggregated profit margin in the dataset; it does not establish causation.

Returns

Returned rows account for 4.56% of transaction rows. The Return Status slicer allows management to investigate returned versus non-returned performance.

4. BRD Business Question Mapping

BRD Question	Dashboard Evidence	Coverage
Overall sales, cost, profit, transactions and units	KPI cards + monthly trends	Strong
Stores and regions contributing most	Store Sales vs Profit + Region slicer	Strong
Stores underperforming vs monthly targets	Store comparison; no target-vs-actual visual	Partial
Products/categories driving revenue and profitability	Product Sales vs Profit + Category Revenue	Partial / Strong
Highest-selling vs most profitable products	Top 10 Product Sales vs Profit	Strong
Discount association with sales/profit	Discount Sales vs Profit	Strong
Returned vs non-returned patterns	Return Status slicer	Partial
Customers/membership contribution	Not included in current dashboard	Not covered
Channels/payment/day/order-time comparison	Sales Channel included; others not shown	Partial
Employee contribution	Not included in current dashboard	Not covered
Major trends/problem areas	Monthly, store, product, category, channel and discount views	Strong for selected scope

5. Management Recommendations

• Prioritize profitability alongside revenue when reviewing stores, products and categories.

• Investigate the gap between the highest-revenue category and the highest-profit category to understand margin differences.

• Review discounting patterns, especially higher discount levels, and evaluate whether discount policies are delivering sufficient commercial value.

• Use the Region slicer to investigate store-level performance and identify locations that merit deeper operational review.

• Review the highest-selling products whose profit contribution is comparatively lower than their sales contribution.

• Use channel performance to guide management discussion around the dominant In-Store channel and opportunities in digital channels.

• Investigate return-status patterns before introducing a formal return-rate KPI.

6. Data Quality & Validation Considerations

The workbook contains **2,500 transaction rows** but only **2,490 unique Invoice_Number values**, with **10** duplicate Invoice_Number occurrences. Therefore, the displayed 2,500 transaction KPI should be understood as a row count unless Invoice_Number uniqueness is confirmed. The BRD specifically requires this validation before using Invoice_Number as the transaction-count basis.

The enriched data also contains missing Store_Name/Store_City values. These should be investigated before making claims about complete store or city coverage. The BRD requires missing values, duplicate records, data types, key fields and logical validity of measures to be reviewed and documented.

7. Limitations & Further Analysis

The current dashboard is intentionally focused on overall performance, trends, stores, products, categories, channels, discounts and interactive filtering. Dedicated customer/membership, employee, payment-mode, day-type, order-time, target-achievement and full return-rate analyses are not represented as dashboard visuals.

Before formal target-achievement conclusions, Monthly_Target alignment with transaction dates should be validated. Return_Status definitions should be reviewed before calculating a formal Return Rate. Supplier information should be treated as descriptive context unless additional procurement/inventory evidence supports a direct sales impact conclusion.

Important: The dashboard identifies patterns and associations. It should not be interpreted as proving that a particular factor causes a change in sales or profitability.

8. Conclusion

The FreshMart dashboard converts transactional data into a consolidated management view that links sales with profitability. Its strongest contribution is enabling management to move beyond revenue-only evaluation and compare sales, profit and business drivers together. The dashboard provides a practical foundation for data-driven decision-making while clearly identifying areas where deeper analysis would be valuable.
